

## 3.1

- (a) Show that any conic in  $\mathbf{A}^2$  is isomorphic either to  $\mathbf{A}^1$  or  $\mathbf{A}^1 - \{0\}$  (cf. Ex. 1.1).
- (b) Show that  $\mathbf{A}^1$  is *not* isomorphic to any proper open subset of itself. (This result is generalized by (Ex. 6.7) below.)
- (c) Any conic in  $\mathbf{P}^2$  is isomorphic to  $\mathbf{P}^1$ .
- (d) We will see later (Ex. 4.8) that any two curves are homeomorphic. But show now that  $\mathbf{A}^2$  is not even homeomorphic to  $\mathbf{P}^2$ .
- (e) If an affine variety is isomorphic to a projective variety, then it consists of only one point.

## 3.2 A morphism whose underlying map on the topological spaces is a homeomorphism need not be an isomorphism.

- (a) For example, let  $\varphi : \mathbf{A}^1 \rightarrow \mathbf{A}^2$  be defined by  $t \mapsto (t^2, t^3)$ . Show that  $\varphi$  defines a bijective bicontinuous morphism of  $\mathbf{A}^1$  onto the curve  $y^2 = x^3$ , but that  $\varphi$  is not an isomorphism.
- (b) For another example, let the characteristic of the base field  $k$  be  $p > 0$ , and define a map  $\varphi : \mathbf{A}^1 \rightarrow \mathbf{A}^2$  by  $t \mapsto t^p$ . Show that  $\varphi$  is bijective and bicontinuous but not an isomorphism. This is called the *Frobenius morphism*.

## 3.3

- (a) Let  $\varphi : X \rightarrow Y$  be a morphism. Then for each  $P \in X$ ,  $\varphi$  induces a homomorphism of local rings  $\varphi_P^* : \mathcal{O}_{\varphi(P), Y} \rightarrow \mathcal{O}_{P, X}$ .
- (b) Show that a morphism  $\varphi$  is an isomorphism if and only if  $\varphi$  is a homeomorphism, and the induced map  $\varphi_P^*$  on local rings is an isomorphism, for all  $p \in X$ .
- (c) Show that if  $\varphi(X)$  is dense in  $Y$ , then the map  $\varphi_P^*$  is injective for all  $p \in X$ .

3.4 Show that the  $d$ -uple embedding of  $\mathbf{P}^n$  (Ex. 2.12) is an isomorphism onto its image.

3.5 By abuse of language, we will say that a variety “is affine” if it is isomorphic to an affine variety. If  $H \subseteq \mathbf{P}^n$  is any hypersurface, show that  $\mathbf{P}^n - H$  is affine. [Hint: Let  $H$  have degree  $d$ . Then consider the  $d$ -uple embedding of  $\mathbf{P}^n$  in  $\mathbf{P}^n$  and use the fact that  $\mathbf{P}^n$  minus a hyperplane is affine.]

3.6 There are quasi-affine varieties which are not affine. For example, show that  $X = \mathbf{A}^2 - \{(0, 0)\}$  is not affine. [Hint: Show that  $\mathcal{O} \cong k[x, y]$  and use (3.5). See (III, Ex. 4.3) for another proof.]

## 3.7

- (a) Show that any two curves in  $\mathbf{P}^2$  have a nonempty intersection.
- (b) More generally, show that if  $Y \subseteq \mathbf{P}^n$  is a projective variety of dimension  $\geq 1$ , and if  $H$  is a hypersurface, then  $Y \cap H \neq \emptyset$ . [Hint: Use (Ex. 3.5) and (Ex. 3.1e). See (7.2) for a generalization.]

---

**3.8** Let  $H_i$  and  $H_j$  be the hyperplanes in  $\mathbf{P}^n$  defined by  $x_i = 0$  and  $x_j = 0$ , with  $i \neq j$ . Show that any regular function on  $\mathbf{P}^n - (H_i \cap H_j)$  is constant. (This gives an alternate proof of (3.4a) in the case  $Y = \mathbf{P}^n$ .)

---

**3.9** The homogeneous coordinate ring of a projective variety is not invariant under isomorphism. For example, let  $X = \mathbf{P}^1$ , and let  $Y$  be the 2-uple embedding of  $\mathbf{P}^1$  in  $\mathbf{P}^2$ . Then  $X \cong Y$  (Ex. 3.4). But show that  $S(X) \not\cong S(Y)$ .

---

**3.10** *Subvarieties.* A subset of a topological space is locally closed if it is an open subset of its closure, or, equivalently, if it is the intersection of an open set with a closed set.

If  $X$  is a quasi-affine or quasi-projective variety and  $Y$  is an irreducible locally closed subset, then  $Y$  is also a quasi-affine (respectively, quasi-projective) variety, by virtue of being a locally closed subset of the same affine or projective space. We call this the induced structure on  $Y$ , and we call  $Y$  a subvariety of  $X$ .

Now let  $\varphi : X \rightarrow Y$  be a morphism, let  $X' \subseteq X$  and  $Y' \subseteq Y$  be irreducible locally closed subsets such that  $\varphi(X') \subseteq Y'$ . Show that  $\varphi|_{X'} : X' \rightarrow Y'$  is a morphism.

---

**3.11** Let  $X$  be any variety and let  $P \in X$ . Show there is a 1-1 correspondence between the prime ideals of the local ring  $\mathcal{O}_P$  and the closed subvarieties of  $X$  containing  $P$ .

---

**3.12** If  $P$  is a point on a variety  $X$ , then  $\dim \mathcal{O}_P = \dim X$ . [*Hint:* Reduce to the affine case and use (3.2c).]

---

**3.13** *The Local Ring of a Subvariety.* Let  $Y \subseteq X$  be a subvariety. Let  $\mathcal{O}_{Y,X}$  be the set of equivalence classes  $\langle U, f \rangle$  where  $U \subseteq X$  is open,  $U \cap Y \neq \emptyset$ , and  $f$  is a regular function on  $U$ . We say  $\langle U, f \rangle$  is equivalent to  $\langle V, g \rangle$  if  $f = g$  on  $U \cap V$ . Show that  $\mathcal{O}_{Y,X}$  is a local ring, with residue field  $K(Y)$  and dimension  $= \dim X - \dim Y$ . It is the local ring of  $Y$  on  $X$ . Note if  $Y = P$  is a point we get  $\mathcal{O}_P$  and if  $Y = X$  we get  $K(X)$ . Note also that if  $Y$  is not a point, then  $K(Y)$  is not algebraically closed, so in this way we get local rings whose residue fields are not algebraically closed.

---

**3.14** *Projection from a Point.* Let  $\mathbf{P}^n$  be a hyperplane in  $\mathbf{P}^{n+1}$  and let  $P \in \mathbf{P}^{n+1} - \mathbf{P}^n$ . Define a mapping  $\varphi : \mathbf{P}^{n+1} - P \rightarrow \mathbf{P}^n$  by  $\varphi(Q) =$  the intersection of the unique line containing  $P$  and  $Q$  with  $\mathbf{P}^n$ .

- (a) Show that  $\varphi$  is a morphism.
  - (b) Let  $Y \subseteq \mathbf{P}^3$  be the twisted cubic curve which is the image of the 3-uple embedding of  $\mathbf{P}^1$  (Ex. 2.12). If  $t, u$  are the homogeneous coordinates on  $\mathbf{P}^1$ , we say that  $Y$  is the curve given parametrically by  $(x, y, z, w) = (t^3, t^2u, tu^2, u^3)$ . Let  $P = (0, 0, 1, 0)$ , and let  $\mathbf{P}^2$  be the hyperplane  $z = 0$ . Show that the projection of  $Y$  from  $P$  is a cuspidal cubic curve in the plane, and find its equation.
- 

**3.15** *Products of Affine Varieties.* Let  $X \subseteq \mathbf{A}^n$  and  $Y \subseteq \mathbf{A}^m$  be affine varieties.

- (a) Show that  $X \times Y \subseteq \mathbf{A}^{n+m}$  with its induced topology is irreducible. [*Hint:* Suppose that  $X \times Y$  is a union of two closed subsets  $Z_1 \cup Z_2$ . Let  $X_i = \{x \in X \mid x \times Y \subseteq Z_i\}$ ,  $i = 1, 2$ . Show that  $X = X_1 \cup X_2$  and  $X_1, X_2$  are closed. Then  $X = X_1$  or  $X_2$  so  $X \times Y = Z_1$  or  $Z_2$ .] The affine variety  $X \times Y$  is called the product of  $X$  and  $Y$ . Note that its topology is in general not equal to the product topology (Ex. 1.4).
- (b) Show that  $A(X \times Y) \cong A(X) \otimes_k A(Y)$ .

- (c) Show that  $X \times Y$  is a product in the category of varieties, i.e., show (i) the projections  $X \times Y \rightarrow X$  and  $X \times Y \rightarrow Y$  are morphisms, and (ii) given a variety  $Z$ , and the morphisms  $Z \rightarrow X$ ,  $Z \rightarrow Y$ , there is a unique morphism  $Z \rightarrow X \times Y$  making a commutative diagram

- (d) Show that  $\dim X \times Y = \dim X + \dim Y$ .

**3.16 Products of Quasi-Projective Varieties.** Use the Segre embedding (Ex. 2.14) to identify  $\mathbf{P}^n \times \mathbf{P}^m$  with its image and hence give it a structure of projective variety. Now for any two quasi-projective varieties  $X \subseteq \mathbf{P}^n$  and  $Y \subseteq \mathbf{P}^m$ , consider  $X \times Y \subseteq \mathbf{P}^n \times \mathbf{P}^m$

- (a) Show that  $X \times Y$  is a quasi-projective variety.  
 (b) If  $X, Y$  are both projective, show that  $X \times Y$  is projective.  
 \*(c) Show that  $X \times Y$  is a product in the category of varieties.

**3.17 Normal Varieties.** A variety  $Y$  is normal at a point  $P \in Y$  if  $\mathcal{O}_P$  is an integrally closed ring.  $Y$  is normal if it is normal at every point.

- (a) Show that every conic in  $\mathbf{P}^2$  is normal.  
 (b) Show that the quadric surfaces  $Q_1, Q_2$  in  $\mathbf{P}^3$  given by equations  $Q_1 : xy = zw$ ;  $Q_2 : xy = z^2$  are normal (cf. (II, Ex. 6.4) for the latter.)  
 (c) Show that the cuspidal cubic  $y^2 = x^3$  in  $\mathbf{A}^2$  is not normal.  
 (d) If  $Y$  is affine, then  $Y$  is normal  $\iff A(Y)$  is integrally closed.  
 (e) Let  $Y$  be an affine variety. Show that there is a normal affine variety  $\tilde{Y}$ , and a morphism  $\pi : \tilde{Y} \rightarrow Y$ , with the property that whenever  $Z$  is a normal variety, and  $\varphi : Z \rightarrow Y$  is a dominant morphism (i.e.,  $\varphi(Z)$  is dense in  $Y$ ), then there is a unique morphism  $e : Z \rightarrow \tilde{Y}$  such that  $\varphi = \pi \circ e$ .  $\tilde{Y}$  is called the normalization of  $Y$ . You will need (3.9A) above.

**3.18 Projectively Normal Varieties.** A projective variety  $Y \subseteq \mathbf{P}^n$  is projectively normal (with respect to the given embedding) if its homogeneous coordinate ring  $S(Y)$  is integrally closed.

- (a) If  $Y$  is projectively normal, then  $Y$  is normal.  
 (b) There are normal varieties in projective space which are not projectively normal. For example, let  $Y$  be the twisted quartic curve in  $\mathbf{P}^3$  given parametrically by  $(x, y, z, w) = (t^4, t^3u, tu^3, u^4)$ . Then  $Y$  is normal but not projectively normal. See (III, Ex. 5.6) for more examples.  
 (c) Show that the twisted quartic curve  $Y$  above is isomorphic to  $\mathbf{P}^1$ , which is projectively normal. Thus projective normality depends on the embedding.

**3.19 Automorphisms of  $\mathbf{A}^n$ .** Let  $\varphi : \mathbf{A}^n \rightarrow \mathbf{A}^n$  be a morphism of  $\mathbf{A}^n$  to  $\mathbf{A}^n$  given by  $n$  polynomials  $f_1, \dots, f_n$  of  $n$  variables  $x_1, \dots, x_n$ . Let  $J = \det[\partial f_i / \partial x_j]$  be the Jacobian polynomial of  $\varphi$ .

- (a) If  $\varphi$  is an isomorphism (in which case we call  $\varphi$  an automorphism of  $\mathbf{A}^n$ ) show that  $J$  is a nonzero constant polynomial.  
 \*\*(b) The converse of (a) is an unsolved problem, even for  $n = 2$ . See, for example. Vitushkin [1].

---

**3.20** Let  $Y$  be a variety of dimension  $\geq 2$ , and let  $P \in Y$  be a normal point. Let  $f$  be a regular function on  $Y - P$ .

- (a) Show that  $f$  extends to a regular function on  $Y$ .
  - (b) Show this would be false for  $\dim Y = 1$ . See (III, Ex. 3.5) for generalization.
- 

**3.21** *Group Varieties.* A group variety consists of a variety  $Y$  together with a morphism  $\mu : Y \times Y \rightarrow Y$ , such that the set of points of  $Y$  with the operation given by  $\mu$  is a group, and such that the inverse map  $y \rightarrow y^{-1}$  is also a morphism of  $Y \rightarrow Y$ .

- (a) The *additive group*  $\mathbf{G}_a$  is given by the variety  $\mathbf{A}^1$  and the morphism  $\mu : \mathbf{A}^2 \rightarrow \mathbf{A}^1$  defined by  $\mu(a, b) = a + b$ . Show it is a group variety.
  - (b) The *multiplicative group*  $\mathbf{G}_m$  is given by the variety  $\mathbf{A}^1 - \{(0)\}$  and the morphism  $\mu(a, b) = ab$ . Show it is a group variety.
  - (c) If  $G$  is a group variety, and  $X$  is any variety, show that the set  $\text{Hom}(X, \mathbf{G}_a)$  has a natural group structure.
  - (d) For any variety  $X$ , show that  $\text{Hom}(X, \mathbf{G}_a)$  is isomorphic to  $\mathcal{O}(X)$  as a group under addition.
  - (e) For any variety  $X$ , show that  $\text{Hom}(X, \mathbf{G}_m)$  is isomorphic to the group of units in  $\mathcal{O}(X)$ , under multiplication.
-
